

Three flows share one backend and one local database. **A**: a policy PDF becomes searchable clauses once a person publishes it. **B**: a question is answered only from the clauses found. **C**: a case is checked clause by clause, and code, not the model, sets the final status. The only outside call is to the model; if it fails, the user finishes the review by hand.

Each numbered step has one job and passes its result to the next. Progress is sent to the browser after every step. Steps marked Python always behave the same way; the three model steps are checked by code before their output is used.
